viaSocket and Hedy logos side by side with an X between them on a light background

Quick answer Hedy's viaSocket integration routes meeting summaries, action items, and highlights into 5,000+ apps with no-code workflows. viaSocket adds an AI assistant that builds workflows from plain-language descriptions. Setup takes 4 steps via the viaSocket integrations directory. Available on Hedy Pro (\$12.99/month).

Hedy's AI meeting assistant now connects to viaSocket, so your meeting summaries, action items, and insights flow directly into the tools your team already uses — no code required.

Connect Your AI Meeting Coach to 5,000+ Apps

viaSocket (<https://viasocket.com>) is a no-code workflow automation platform that connects apps and services through a visual builder. With this integration, Hedy can trigger actions in your tools automatically — the moment a session ends or a highlight (</post/ai-meeting-highlights-zettelkasten>) is

captured. No copying, no pasting, no manual follow-up steps.

If you've used other integration tools before, the concept is similar: Hedy produces the meeting intelligence, and viaSocket routes it wherever you need it.

Automate Meeting Summaries, Action Items, and Notes

Every Hedy session produces structured data: summaries, detailed notes, to-do items (</post/smart-todo-ai-tracking-meetings>), transcripts, and highlights with AI analysis. viaSocket lets you route any of that data into other tools the moment it's created.

Here are some practical examples:

Send meeting summaries to Slack and log them in Notion. When a session ends, the summary goes to your team channel and a structured page gets created in your workspace — no copying, no pasting.

Route action items to your task manager. Hedy automatically extracts to-do items (</post/smart-todo-ai-tracking-meetings>) from your conversations. viaSocket can push those directly into Asana, Trello, ClickUp, or whatever you use to track work.

Update your CRM after client calls. Session summaries and key discussion points can be logged as activities on the relevant HubSpot contact or deal. Your pipeline stays current without manual data entry.

Build a meeting log in Google Sheets. Every completed session appends a row with the date, topic (</post/ai-meeting-topics-organize-sessions>), and outcomes. Useful for teams that track meeting cadence or need a searchable record.

Trigger follow-up emails with next steps. Session summaries and to-do items can populate a follow-up email in Gmail or Microsoft Outlook, sent while the conversation is still fresh.

These are starting points. viaSocket supports over 5,000 apps, so the combinations depend on your workflow.

Available Webhook Triggers

The integration supports the same webhook triggers available across our other automation platforms:

- Session completed — fires when a Hedy session ends, providing the summary, detailed notes, to-do items, and transcript
- Highlight created — fires when you capture a highlight (</post/ai-meeting-highlights-zettelkasten>) during a session, including the AI-generated analysis and context

Each trigger can kick off one or multiple actions in your connected apps.

How to Set Up the Hedy + viaSocket Integration

1. Make sure you have a Hedy Pro subscription (</pricing/>) (automations require Pro)
2. Generate your API key in Hedy's Account Settings
3. Set up a webhook (</help/hedy-api/>) in Hedy pointing to your viaSocket workflow, or connect through viaSocket's Hedy integration page (<https://viasocket.com/integrations/hedyai>)
4. Build your workflow in viaSocket's visual editor — no code required

If you're new to workflow automation, viaSocket's visual builder makes it straightforward to map Hedy's data to actions in your other tools. You can also use viaSocket's AI assistant to help you design workflows from a plain-language description.

Part of a Growing Automation Ecosystem

viaSocket joins Zapier (</post/automate-meeting-summaries-zapier>) , n8n (</post/hedy-ai-n8n-meeting-automation-integration>) , ActivePieces (</post/hedy-meeting-assistant-activepieces-integration-automation>) , and Pabbly Connect as official Hedy integration partners. We also support direct webhook configuration and a REST API (</post/hedy-api-ai-meeting-integration>) for custom integrations.

Our goal is to make sure Hedy fits into however you already work — not the other way around. Whether you prefer a specific automation platform or want to build something custom, the data from your conversations is available where you need it.

Frequently Asked Questions

Do I need a Hedy Pro subscription to use the viaSocket integration?

Yes. Webhook triggers, API access, and automation integrations are part of Hedy Pro (\$12.99/month or \$99.99/year).

What data does Hedy send to viaSocket when a session completes?

The session.ended trigger includes the full summary, detailed meeting notes, extracted to-do items, topic insights, and the session transcript. You choose which fields to use in your viaSocket workflow.

How is viaSocket different from Zapier for Hedy automations?

Both work through Hedy's webhook system and provide the same triggers. viaSocket includes an AI assistant that builds workflows from plain-language prompts, supports 5,000+ apps, and has a visual no-code editor. Choose whichever platform matches your existing automation setup.

Can I use viaSocket and Zapier at the same time?

Yes. Hedy supports up to 50 webhook endpoints per account, so you can route the same triggers to multiple platforms simultaneously. There's no conflict between viaSocket, Zapier, n8n, ActivePieces, or any other automation platform.

Do I need coding skills to set up viaSocket automations?

No. viaSocket provides a visual no-code workflow builder. You can also describe what you want in plain language and viaSocket's AI assistant will help build the workflow for you.
